Distributed Computing in Dynamic Networks — Impact of the dynamics on definitions and feasibility

Arnaud Casteigts

University of Bordeaux

Distributed Computing

Collaboration of distinct entities to perform a common task.

No centralization available. Direct interaction.

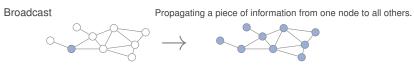

(Think globally, act locally)

Broadcast

Propagating a piece of information from one node to all others.

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

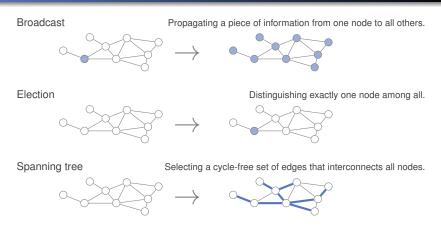

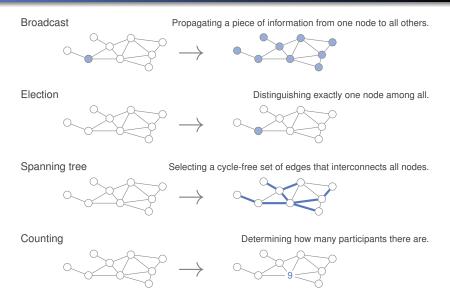

Election

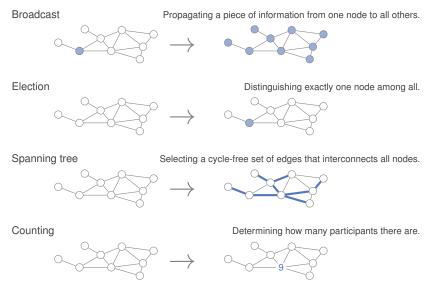

Distinguishing exactly one node among all.

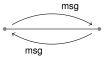

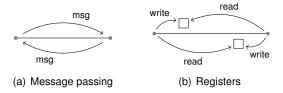

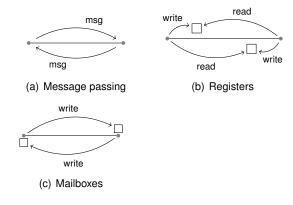

Consensus, naming, routing, exploration, ...

Many other concepts... (ask me !).

Topological assumptions for distributed algorithms

Feasibility, Necessary and sufficient conditions, ...

Ex : Broadcast algorithm $\bullet \longrightarrow \bullet \longrightarrow \bullet$

Ex : Broadcast algorithm $\bullet \longrightarrow \bullet \longrightarrow \bullet$

15/20

• • • • • • • •

Ex : Broadcast algorithm $\bullet \longrightarrow \bullet \longrightarrow \bullet$

Lucky version.

Ex : Broadcast algorithm $\bullet \frown \circ \to \bullet \frown \bullet$

Lucky version.

Lucky version.

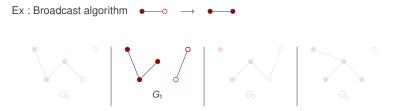

Lucky version. Yeah !!

But things could have gone differently.

Ex : Broadcast algorithm $\bullet \multimap \to \bullet \multimap$ G_0 G_1 G_2 G_3

But things could have gone differently.

But things could have gone differently.

But things could have gone differently. Too late !

Ex : Broadcast algorithm $\bullet \multimap \to \bullet \bullet$

But things could have gone differently. Too late !

Ex : Broadcast algorithm $\bullet \multimap \to \bullet \bullet$

But things could have gone differently. Too late !

But things could have gone differently. Too late ! Failure !

Ex : Broadcast algorithm $\bullet \longrightarrow \bullet \longrightarrow \bullet$

Or even worse ..

Ex : Broadcast algorithm $\bullet \frown \circ \to \bullet \frown \bullet$

Or even worse.. Too fast !

Ex : Broadcast algorithm $\bullet \longrightarrow \bullet \longrightarrow \bullet$

Or even worse.. Too fast ! Too fast !

Ex : Broadcast algorithm $\bullet \longrightarrow \bullet \to \bullet$

Or even worse.. Too fast ! Too fast ! Failure !

Ex : Broadcast algorithm $\bullet \multimap \to \bullet \bullet \bullet$

 \implies Additional assumptions needed to guarantee something.

Ex : Broadcast algorithm $\bullet \frown \circ \rightarrow \bullet \frown \bullet$

 \implies Additional assumptions needed to guarantee something.

Assumption : Every present edge is "selected" at least once (but we don't know in what order...)

 \implies Additional assumptions needed to guarantee something.

Assumption : Every present edge is "selected" at least once (but we don't know in what order...)

 \rightarrow Now, is the success guaranteed ?

 \implies Additional assumptions needed to guarantee something.

Assumption : Every present edge is "selected" at least once (but we don't know in what order...)

- \rightarrow Now, is the success guaranteed ?
- \rightarrow Is the success possible ?

 \implies Additional assumptions needed to guarantee something.

Assumption : Every present edge is "selected" at least once (but we don't know in what order...)

- \rightarrow Now, is the success <code>guaranteed</code> ?
- \rightarrow Is the success <code>possible</code> ? Of course, but why ?

 \implies Additional assumptions needed to guarantee something.

Assumption : Every present edge is "selected" at least once (but we don't know in what order...)

- \rightarrow Now, is the success <code>guaranteed</code> ?
- \rightarrow Is the success <code>possible</code> ? Of course, but why ?

Because (src → *)

 \implies Additional assumptions needed to guarantee something.

Assumption : Every present edge is "selected" at least once (but we don't know in what order...)

- \rightarrow Now, is the success guaranteed ? Why not ?
- \rightarrow Is the success <code>possible</code> ? Of course, but why ?

Because (src → *)

 \implies Additional assumptions needed to guarantee something.

Assumption : Every present edge is "selected" at least once (but we don't know in what order...)

 \rightarrow Now, is the success <u>guaranteed</u>? Why not?

 \rightarrow Is the success possible? Of course, but why?

Because \neg (*src* $\stackrel{st}{\rightsquigarrow} *$) Because (*src* $\rightsquigarrow *$)

 \implies Additional assumptions needed to guarantee something.

Assumption : Every present edge is "selected" at least once (but we don't know in what order...)

Notions of *necessary condition* (e.g. $src \rightsquigarrow *$) or *sufficient condition* (e.g. $src \stackrel{st}{\rightsquigarrow} *$) for a given algorithm. These conditions relate only to the topology.

Ex : Broadcast algorithm $\bullet \circ \to \bullet \bullet$

 \implies Additional assumptions needed to guarantee something.

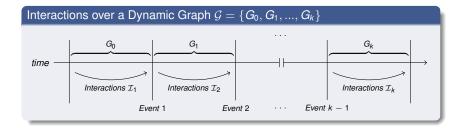

Assumption : Every present edge is "selected" at least once (but we don't know in what order...)

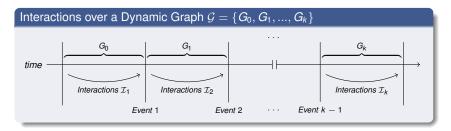

→ Now, is the success guaranteed? Why not? Because $\neg(src \stackrel{st}{\rightsquigarrow} *)$ → Is the success possible? Of course, but why? Because $(src \rightsquigarrow *)$

Notions of *necessary condition* (e.g. $src \rightsquigarrow *$) or *sufficient condition* (e.g. $src \stackrel{st}{\rightsquigarrow} *$) for a given algorithm. These conditions relate only to the topology.

More formally ...

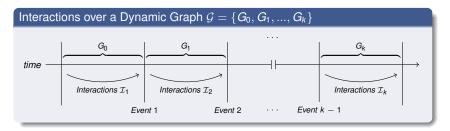

An execution is an alternated sequence of interactions and topological events :

 $X = \mathcal{I}_k \circ Event_{k-1} \circ .. \circ Event_2 \circ \mathcal{I}_2 \circ Event_1 \circ \mathcal{I}_1(G_0)$

An execution is an alternated sequence of interactions and topological events :

 $X = \mathcal{I}_k \circ Event_{k-1} \circ .. \circ Event_2 \circ \mathcal{I}_2 \circ Event_1 \circ \mathcal{I}_1(G_0)$

Non deterministic !

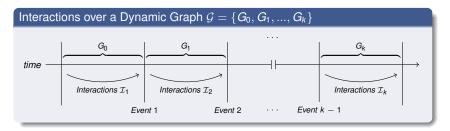

An execution is an alternated sequence of interactions and topological events :

 $X = \mathcal{I}_k \circ Event_{k-1} \circ .. \circ Event_2 \circ \mathcal{I}_2 \circ Event_1 \circ \mathcal{I}_1(G_0)$

Non deterministic !

 $\rightarrow \mathcal{X}$: set of all possible executions (for a given algorithm and graph \mathcal{G}).

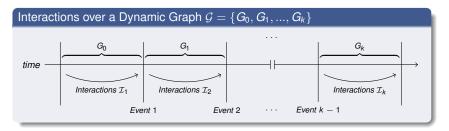

An execution is an alternated sequence of interactions and topological events :

 $X = \mathcal{I}_k \circ Event_{k-1} \circ .. \circ Event_2 \circ \mathcal{I}_2 \circ Event_1 \circ \mathcal{I}_1(G_0)$ Non deterministic !

 $ightarrow \mathcal{X}$: set of all possible executions (for a given algorithm and graph \mathcal{G}).

What makes a graph property \mathcal{P} a necessary or sufficient condition for success on \mathcal{G} ?

 \rightarrow <u>Necessary condition</u> : $\neg \mathcal{P}(\mathcal{G}) \implies \forall X \in \mathcal{X}$, failure(X).

An execution is an alternated sequence of interactions and topological events :

 $X = \mathcal{I}_k \circ Event_{k-1} \circ .. \circ Event_2 \circ \mathcal{I}_2 \circ Event_1 \circ \mathcal{I}_1(G_0)$ Non deterministic !

 $\rightarrow \mathcal{X}$: set of all possible executions (for a given algorithm and graph $\mathcal{G}).$

What makes a graph property \mathcal{P} a necessary or sufficient condition for success on \mathcal{G} ?

- \rightarrow <u>Necessary condition</u> : $\neg \mathcal{P}(\mathcal{G}) \implies \forall X \in \mathcal{X}$, failure(X).
- \rightarrow Sufficient condition : $\mathcal{P}(\mathcal{G}) \implies \forall X \in \mathcal{X}$, success(X).

٩	Satisfied	\implies	success	is	guaranteed
---	-----------	------------	---------	----	------------

 $(\nexists X, failure(X))$

• Not satisfied \implies failure is guaranteed	$(\nexists X, success(X))$
• Satisfied \implies success is possible	$(\exists X, success(X)).$

Tight	Cufficient	aanditian
rigni	Suncient	condition

- Satisfied success is guaranteed
- Not satisfied \implies failure is possible

 $(\nexists X, failure(X))$

 $(\exists X, failure(X))$

• Not satisfied \implies failure is guaranteed	$(\nexists X, success(X))$
• Satisfied \implies success is possible	$(\exists X, success(X)).$

Tight Sufficient condition	
• Satisfied \implies success is guaranteed	$(\nexists X, failure(X))$
• Not satisfied \implies failure is possible	$(\exists X, failure(X))$

Remark : Topological conditions which are both necessary and sufficient may not exist !

 Not satisfied ⇒ failure is guaranteed 	$(\nexists X, success(X))$
• Satisfied \implies success is possible	$(\exists X, success(X)).$

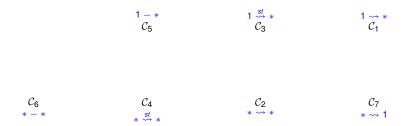

Tight Sufficient condition	
• Satisfied \implies success is guaranteed	$(\nexists X, failure(X))$
• Not satisfied \implies failure is possible	$(\exists X, failure(X))$

Remark : Topological conditions which are both necessary and sufficient may not exist !

Ex. uniform counting (last algorithm) :

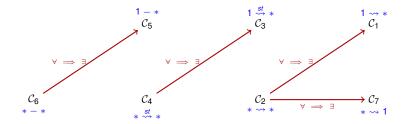

- \rightarrow (* \rightarrow 1) is a tight necessary condition
- \rightarrow (*-*) is a tight sufficient condition

In between : outcome is uncertain... might succeed or fail.
